“Cerebral organoids with the MAPT R406W mutation model lipid dyshomeostasis, increased tau phosphorylation, and effects on neuronal function observed in FTD”

Harry Fu, PhD
Assistant Professor, Department of Neuroscience

Mutations in the MAPT gene can cause Frontotemporal Dementia (FTD) and several other tauopathies. This presentation will cover preliminary results characterizing the effects of MAPT R406W mutation on tau phosphorylation, neuronal function, and lipid metabolism using the unguided neural organoid model.
