“Chronic brain injury caused by interpersonal violence: a mechanism fueling health disparities?”

Julianna Nemeth, PhD, MA | Assistant Professor | College of Public Health

Dr. Nemeth is a health equity intervention scientist whose work focuses on increasing access to public health protections in community settings to improve population health, as well as on optimizing behavioral interventions for scalability in low-resource settings. She will present her research findings from studies with service-seeking domestic violence survivors and homeless youth. Her findings have led her to hypothesize that chronic brain injury caused by interpersonal violence is a mechanism fueling health disparities for many of our country’s most at-risk populations. As an emerging field within brain injury research, she will also present opportunities for collaboration.
